# **Optimizing Income over Feed Supplement Costs**

Victor E. Cabrera, Randy D. Shaver, and Michel A. Wattiaux

Department of Dairy Science, University of Wisconsin

#### INTRODUCTION

- Large fluctuations in milk and supplemental feed prices create anxiety and uncertainties.
- Usually, more than 90% of dairy farm revenue comes from the milk check and more than 40% of the expenses are used on purchased feeds
- It is important that correct decisions are made to maximize return on supplemental feed expenses.

- Traditional diet formulation is based on finding the least cost ration that provides the minimum level of required nutrients for a desired level of milk production (Tozer, 2000; Howard et al., 1968)
- Typically, diet formulation does not consider changes in milk production due to changes in CP, RUP and RDP that could be fine-tuned to maximize income over feed supplement costs

- Analyses from surface responses to income over feed cost for different crude protein (CP) levels have been studied in the past (Roffler et al., 1986)
- the distinction between rumen undegradable protein (RUP) protein and rumen degradable protein (RDP) creates a need to further finetune the formulation of supplements for maximum income over feed cost.

- Rotz et al. (1999) found that profitability of dairy farms could be improved by decreasing CP intake and adjusting RUP and RDP through a better selection of fed ingredients, which vary according to market prices of feed stuffs
- Lower CP diets decrease N excretion and consequently environmental impacts (Rotz et al., 1999; Broderick, 2003; Wattiaux and Karg, 2004)

- Rotz et al. (1999) developed the dairy farm model (DAFOSYM) capable to estimate the income over supplement costs, which nowadays has evolved to the integrated farm system model (IFSM) (Rotz et al., 2007)
- Although very complete, IFSM is i) complex and serves the scientific community more than field-based end-users and ii) it does not perform optimization analyses.

#### **OBJECTIVE**

 Present a simple formulation to optimize income over feed supplement costs (IOFSC), implement the formulation into a userfriendly spreadsheet, and perform some case studies.

$$\max(MV - \sum_{i=1}^{N} SV_i)$$

MV = milk value = Mp x MPx  $SV_i$  = value of the i supplement = Sp<sub>i</sub> x SQ<sub>i</sub>

 $DMI = (0.372 * FCM + 0.0968 * BW^{0.75}) * (1 - e^{(-0.192*(WOL + 3.67))})$ 

 $MPx = -55.61 + 1.15 * DMI + 8.79 * RDP - 0.36 * RDP^2 + 1.85 * RUP$ 

NRC (2001)

$$\sum_{i=1}^{N} SQ_i = DMI$$

$$SQ_i \le \max SQ_i...for...i = 1toN$$

 $RUP \leq \max RUP$ 

 $RDP \leq \max RDP$ 

 $CP \leq \max CP$
